

People data base application

1. Create data mode corresponding to person and address.

Example:

```
class Person {  
    private String name;  
        private String surname;  
        private int age;  
        private int height;  
        private Double weight;  
    private Address address;  
}
```

```
class Address {  
    private String city;  
    private String zipCode;  
    private String street;  
    private int homeNumber;  
}
```

2. Create DAO to manage operations on Person.
3. Create service which enable application to:
 - list basic people info
 - check details of given person
 - edit/remove/add person
 - edit person's address data
 - *- search for person base on name or surname
 - *- list basic people info sorted by given criteria (name/surname/age/city/street)
4. Create simple GUI or CLI to manage our application

NOTE:

- It's up to use which technology you use (JPA or JDBC or Hibernate).
- Project must be version controlled in git!
- TTD is always good choose!
